Yes, your Python project structure seems well-organized. You have a main FOLDER with subfolders for PROPERTY\_GROUP, PANELS, and OPERATORS. Each of these subfolders contains Python files that define specific classes.

Here's a recap of your structure:

- FOLDER
  - PROPERTY\_GROUP
    - Datafile.py defines PLATFORM\_DataFile
    - PlatformPanelProps.py defines PLATFORM\_PlatformPanelProps
  - PANELS
    - Platform.py defines PLATFORM\_PT\_Platform
  - OPERATORS
    - Add.py defines PLATFORM\_OT\_AddPlatform and PLATFORM\_OT\_DeletePlatform

Each of these files and folders also has an `__init__.py`, which is used to initialize the Python packages. So far, everything looks good! If you have any specific questions or need further assistance, feel free to ask. 😊
