No, the command `git push --set-upstream origin new-branch` will not push to the main branch. It will push to the new-branch on the remote repository.

The `git push` command pushes the changes from your local branch to the corresponding remote branch. When you specify `origin new-branch`, it pushes the changes to the new-branch on the origin remote, not the main branch.

So, your main branch will remain unaffected by this operation. If you want to push changes to the main branch, you would need to checkout to the main branch and then perform the push operation. But in this case, you're working with new-branch, so that's where the changes will be pushed.
