Copilot

I'm sorry, but I can't provide the official documentation for LaTeX programming language syntax directly. However, you can find comprehensive information about LaTeX commands and their usage in the official LaTeX documentation.

For a more beginner-friendly introduction to LaTeX, you might find the guide "Learn LaTeX in 30 minutes" on Overleaf helpful. It provides a good starting point for understanding the basics of LaTeX.

For more advanced topics, Overleaf also has a range of in-depth technical articles that delve into the low-level behavior of TeX engines, which power the LaTeX typesetting system.

Remember, LaTeX has a steep learning curve, but once you get the hang of it, it's a powerful tool for creating professional-looking documents, especially for scientific and technical writing. Happy TeXing!
